

California Rapid Assessment Method (CRAM) Locations

The California Rapid Assessment Method is a standardized, cost-effective tool for assessing the overall health of wetlands, streams, and their riparian areas in California. CRAM generates numerical scores based on field evaluations for multiple attributes of physical and biotic condition. Scores are relative to the best achievable condition based on statewide surveys. There are different modules of CRAM for different types of wetlands and streams, as classified in the California Aquatic Resource Inventory (CARI).
